

Objects in Space

<p><b>Inner Planets</b></p>		<ul style="list-style-type: none"> <li>• <u>In order</u>: Mercury, Venus, Earth, Mars</li> <li>• Made of rock and metal</li> <li>• Warm</li> <li>• Small</li> <li>• no rings</li> <li>• few moons</li> </ul>
<p><b>Outer Planets</b></p>		<ul style="list-style-type: none"> <li>• In order: Jupiter, Saturn, Uranus, Neptune.</li> <li>• Made of gas (mostly) <ul style="list-style-type: none"> <li>- Might have rocky cores</li> </ul> </li> <li>• Cold</li> <li>• large</li> <li>• All have rings</li> <li>• Many moons</li> </ul>
<p><b>Sun</b></p>		<ul style="list-style-type: none"> <li>• Big ball of gas* (mostly Hydrogen) <i>actually</i></li> <li>• Energy from nuclear fusion</li> <li>• Solar flares (giant explosions) create our northern lights</li> </ul>

<p>Solar System</p>		<p>The sun and everything that orbits around it.</p>
<p>Stars</p>		<ul style="list-style-type: none"> <li>• Big <sup>hot</sup> spheres of gas* (mostly Hydrogen)</li> <li>• Binary stars are pairs of stars that orbit each other</li> <li>• Sizes vary → dwarf - supergiants</li> <li>• Colors vary → Red, orange, yellow, white, blue</li> </ul>
<p>Milky Way Galaxy</p>		<ul style="list-style-type: none"> <li>• Our galaxy</li> <li>• spiral galaxy</li> <li>• <math>\approx 100,000</math> light years across</li> </ul>
<p>Outer Galaxies</p>		<ul style="list-style-type: none"> <li>• Millions or billions of stars held together by gravity.</li> <li>• <sup>3</sup>Shapes: ① Spiral, ② elliptical (oval), ③ Irregular (no shape)</li> <li>• Andromeda is the closest galaxy to ours</li> </ul>

Supernova		<ul style="list-style-type: none"> <li>• The dying explosion of a large star</li> <li>• Very bright (as bright as 10 billion suns)</li> <li>• Usually shine brightly for 1 or 2 months</li> </ul>
Nebula		<ul style="list-style-type: none"> <li>• Cloud of dust and "frozen gas"</li> <li>• May evolve into solar systems.</li> <li>• Produced by the Big Bang and by Supernova explosions</li> </ul>
Black Holes		<p>Black area around</p> <ul style="list-style-type: none"> <li>• Very dense points of matter formed by a compressed "dead" star.</li> <li>• Gravity is so strong that light cannot escape.</li> <li>• Cannot be seen, so scientists look for the effects of their gravity.</li> </ul>
Comets		<ul style="list-style-type: none"> <li>• "Dirty snowballs" - made of dust and ice</li> <li>• The tail is caused by dust and ice trailing behind and getting melted and pushed away by the sun.</li> </ul>

- Tail points away from sun

<p>Meteors, meteoroids, meteorites</p>		<ul style="list-style-type: none"> <li>• All are space rocks</li> <li>• Asteroids are outside the atmosphere</li> <li>• Meteors are "shooting stars," rock burning up due to friction in the atmosphere.</li> <li>• Meteorite: a meteor that survives and lands on Earth.</li> </ul>
<p>Asteroids</p>		<ul style="list-style-type: none"> <li>• Bigger than meteors, smaller than planets</li> <li>• Asteroid Belt: contains most asteroids. Found between orbits of Mars + Jupiter.</li> </ul>
<p>Constellations</p>		<ul style="list-style-type: none"> <li>• A group of stars that can be connected, "dot-to-dot" to create an image.</li> <li>• Circumpolar: A constellation that we can see all year long.</li> <li>• Orion is <u>not</u> circumpolar.</li> <li>• Big Dipper <u>is</u> circumpolar.</li> </ul>
